1.0 Introduction

Clean Nova Scotia is a not-for-profit organization established in 1988. Clean Nova Scotia's mission is to inspire environmental change through education and action. Clean Nova Scotia administers a number of programs related to climate change, transportation, energy, and water. Clean Nova Scotia has made part of its mandate the protection and conservation of waterways in Nova Scotia. In working towards this goal, the organization has carried out restoration work on a number of streams in the Halifax Regional Municipality, including Parker's Brook in Bedford and Grassy Brook in Dartmouth.

In August of 2009, Clean Nova Scotia initiated the Stream Survey and Restoration Development Program (SSRDP) with the help of the Nova Scotia Salmon Association's Adopt-a-Stream Program. The purpose of the SSRDP is to identify water systems of environmental concern, complete detailed surveys of the selected systems and develop easy-to-follow restoration plans aimed at improving fish passage and habitat quality in the surveyed systems. SSRDP restoration plans are designed to be implemented by small- to moderately-sized community group crews that may have limited experience with stream restoration activities. The watercourse of Ellenvale Run in Dartmouth, Nova Scotia, was the first project undertaken by Clean Nova Scotia's SSRDP, with surveying and habitat assessment starting in September 2009 and finishing in June 2010. Installation of instream structures took place in the summer of 2009 and 2010 and will continue in the summer of 2011.

1.1 Why Frenchman's Brook?

Frenchman's Brook is located in an industrial and commercial area of Dartmouth, Nova Scotia. The brook originates from its headwaters at Spectacle Lake and Frenchman Lake, and flows east through two commercialized districts: Burnside Park and Dartmouth Crossing. The watercourse is approximately 2 km in length; it begins in Burnside Park, flows through Dartmouth Crossing and dispenses into Lake MicMac.

Clean Nova Scotia undertook a restoration project on Frenchman's Brook in the summer of 2010. This project included riparian planting along the stream banks that had been compromised during quarry blasting and was subsequently rebuilt during the construction of Dartmouth Crossing. During the riparian planting project, it became clear that there were still a lot of unanswered questions about the habitat quality in the rest of the watercourse. In hopes of answering some of these questions, the SSRDP staff initiated a survey to determine the water quality of Frenchman's Brook and to explore opportunities for improving fish habitat through physical restoration activities. Upon completion of the survey, the following detailed restoration plan was generated. The information provided in this restoration plan is to serve as the basis for subsequent discussions about actions or management strategies to improve habitat quality for plant and animal species in and around Frenchman's Brook.

1.2 Goals

Before tackling further restoration work on Frenchman's Brook, the Stream Survey and Restoration Development Program staff identified broad, far-reaching goals that must be met if any future restoration work is to have enduring success. The goals are long term because keeping an urban stream in good condition requires vigilant work.

The following goals have been recognized:

- Develop a full understanding of Frenchman's Brook, its limitations, biological potential, and impact on the surrounding community
- Prepare a comprehensive action plan that is easy for most people to understand, full in scope, yet focused in step by step procedures on smaller scales
